Non-slip full tiles for the bottom of pits

1 Fixing elements

Tiles can be laid loose or glued with a two-component polyurethane glue.

2 Storage

If tiles are not installed immediately, it is better to shelter them from light and bad weather. Before starting the installation, make sure that the temperature of the tiles is between 15 °C and 30 °C (put the tiles in a place where the temperature is within this range if it is not the case outdoors).

3 Support

The support for the tiles shall be rigid enough (concrete or asphalt) and shall have an even surface so that the tile rests on all of it. The surface will ideally have a slope of about 1%. An uneven floor shall priorly be levelled.

Before laying, clean up the support and let it dry.

4 Laying

Connect the tiles with each others using a rubber mallet. Make sure to keep an expansion joint on each extremity of about 1% or 2 cm minimum.

In case of gluing, the floor must be perfectly dry before starting. Mix the glue with the hardener. Spread the glue with a notched trowel. Place the tiles and let dry for 24h.

5 Maintenance

Tiles can be scraped using a hand scraper and cleaned with a water jet cleaner or a high-pressure cleaner (do not exceed 60 bars and 30 °C).
